

- 7 years as a full-stack developer, with ownership over codebases and architectural decisions
- 3 years slotting into start up teams, working independently on ambiguous problems while also keeping leadership in the loop and ensuring team members are comfortable and unblocked
- Strong mathematical foundation, my most enjoyable modules at university being partial differential equations and cryptography
- Big on sharing knowledge within a team; I think even complex concepts can be conveyed simply, and knowledge is for everyone :)
- Prioritise accessibility, ensuring disabled people have equal access to anything I build

Relevant skills

NextJS | React | TypeScript | Python | Tailwind CSS | PostgreSQL | GitHub | Linear | Socket.IO
 Numpy | Calculus | Understanding of utility theory

Education

Mathematics BSc, Newcastle University, 1st
 Informatics MSc (machine learning algorithmic theory and code implementation), University of Edinburgh, 2:1

Employment

Founding engineer	Dream XV Rugby (have a play here!)	Jan 2024-present (now part-time)
• Transformed the CEO’s idea of a fantasy rugby game into a technical reality, architecting and owning the NextJS codebase and infrastructure from ground zero • Used Socket.IO to update users’ real-time fantasy scores during live rugby matches, weighing up trade-offs between development speed, cost and scalability • Provided founders with role-based admin access to view and change data • Prioritised allowing disabled people to play by creating a library of reusable, accessible base components • Advocated for and set up Jest tests from day 1, implementing GitHub Actions to ensure all tests pass before merging new work • On-call to monitor the availability and performance of the site during matches		
Full-stack contract engineer	Various for-good companies	2023, short term contracts
• Crafted a specific table-extracting Python algorithm based on text location and regex to turn a client’s annotation idea into a tangible solution when existing computer vision libraries were not reliable enough • Fixed an ambiguous problem where a company didn’t understand why the temperature plot of their data collected by their food-waste-saving robot was nonsensical and not displaying as grain piles as expected (spoiler: the graph needed to know which points were intentionally null) • Built, researched and architected several MVPs for companies to showcase • Guided on security improvements to protect sensitive customer information • Advised on how to make a mindmap creation tool accessible to disabled users		
Senior full-stack engineer	OpenMoney	2019-2023
• Sought out by internal mortgage advisor to create and code an algorithm to predict a user’s mortgage term • Traded speed and availability in favour of data correctness and security when handling sensitive financial information		

- Started and maintained a company-wide React/TypeScript component library to keep a consistent UI after noticing redundant duplicate components
- Built a fully online mortgage application service (no phone calls!) and several onboarding journeys serving thousands of people a day
- Led a team creating a product dashboard, upskilling the engineers in the team by deepening their understanding of React
- Presented a very well-received pitch entitled 'Are we accessible?' to all members of the company, which led to me leading tangible changes to the accessibility of our products

Freelance web developer

Various companies

2018-2019

- Solved a hodgepodge of problems people were having that required custom code, e.g. I saved a family business ~6 hours a week by automating the cleaning and transforming of their housing data

Projects

- [Website](#) for experiencing web accessibility barriers first-hand and learning the simple code tweaks to fix them
- [Poster](#) simplifying the web content accessibility guidelines (which are officially listed as an ironically quite inaccessible very, very long wall of text)
- Created a local Chrome extension to limit tabs to 3 to curb spontaneous quests for knowledge when focussing
- Created a personal version of Trello (by combining a notes app, a sticky notes app which always stays on top of the screen and an AutoHotKey script) because I wanted to always display the current task on my screen, whereas Trello requires you to visit a tab
